Proposal for Client

Prepared on 23 September 2026

English

Overview

This proposal outlines a web-based management system tailored for an HVAC service company. The system will provide distinct administrative and customer interfaces to streamline service management, customer interactions, and internal operations.

Client Requirements

- **User Management:** The system must support an admin role and up to four staff roles. It must include functionality to add, edit, and delete staff members.
- **Sales & Proposals:** The system requires a feature to create and manage proposals for clients, which can be delivered via a PDF generation service.
- **Customer Portal:** Customers should be able to access their accounts using a bill number and mobile number. Upon access, they should be directed to a dashboard where they can view their details and raise service requests.
- **Service Management:** The system must allow staff to check the status of service requests and forward them to the admin.
- **Product & Category Management:** The system must include an option to add categories and products.
- **WhatsApp Chatbot:** An AI assistant must be implemented on WhatsApp to handle customer queries regarding the company and its AC services. The chatbot must provide support, reply to queries, and display contact details for further assistance or forwarding.
- **System Hosting:** The client will decide whether to purchase and host the server externally or use the proposed hosting option.

Variations in Schema

No schema variations identified from the customer requirements discussed in this meeting.

Proposed Solution

A comprehensive web application featuring:

- A secure admin dashboard with full staff management capabilities (add, edit, delete).
- A customer-facing portal accessible via bill number and mobile number, providing a personalized dashboard for service request submission and status tracking.
- A quotation and proposal generation module integrated with a PDF generation service for automated client delivery.
- A centralized service management interface for staff to manage, track, and forward service issues to the admin.
- A product and category management module for cataloging HVAC products and spare parts.
- An integrated WhatsApp AI chatbot to automate customer support, answer queries, and facilitate direct contact.

Scope of Work

- Development of the web-based admin and staff portal.
- Development of the customer-facing portal with authentication, dashboard, and service request functionalities.
- Implementation of the quotation, proposal, and PDF generation features.
- Configuration of the WhatsApp AI chatbot with predefined responses and contact forwarding.
- Setup of product and category management tools.
- Configuration of the system for either client-hosted or externally hosted servers.

Timeline

Not discussed in this meeting — to be confirmed with the client.

Pricing

Not discussed in this meeting — to be confirmed with the client.

Next Steps

- Review and approve the formal proposal.
- Confirm the preferred server hosting arrangement (external purchase vs. proposed hosting).

- Schedule a technical kickoff meeting to finalize system specifications.
- Provide access to necessary company data to begin development.
