# Proposal for Client

*Prepared on 23 September 2026*

# English

## Overview

This proposal outlines a web application solution designed to automate and manage the client's air conditioning service operations. The system aims to streamline service request handling, technician assignment, and daily performance tracking for a team of 10 to 12 service staff.

## Client Requirements

- **Service Request Management:** A centralized system to automatically receive, track, and manage service requests and complaints.
- **Intelligent Automated Assignment:** Service requests must be automatically assigned to available technicians based on their current location and workload.
- **Technician Workload Management:** The system must track the number of active assignments per technician in a specific area to prevent overload, using an efficient algorithm.
- **Technician Performance Tracking:** The system must prevent technicians with negative customer feedback or low ratings from being assigned new requests.
- **Daily Activity Reporting:** A separate reporting mechanism for technicians to log their daily activities.
- **Managerial Tracking:** An email notification system for managers to receive updates on service progress (e.g., status, completion, pending cases, and outstanding payments).
- **Daily Attendance:** Technicians must be able to mark their attendance.

## Variations in Schema

No schema variations identified from the customer requirements discussed in this meeting.

## Proposed Solution

- A custom web application featuring distinct interfaces for staff (technicians) and administrators.
- An automated routing engine that assigns service requests to technicians based on geographical proximity and current workload.
- A performance dashboard to monitor active assignments, track request completion status, and flag technicians with negative feedback.
- A daily reporting module for technicians to log their daily service activities and new product sales.
- An automated email alert system for management regarding service status.

## Scope of Work

- Development of a web-based service management application.
- Configuration of automated service request intake and status tracking.
- Implementation of location-based and workload-based technician assignment logic.
- Integration of a daily activity and attendance tracking feature for technicians.
- Setup of automated email notifications for managerial updates.
- Provisioning of hosting infrastructure (to be confirmed with the client).

## Timeline

Not discussed in this meeting — to be confirmed with the client.

## Pricing

Not discussed in this meeting — to be confirmed with the client.

## Next Steps

- LiveAs Technologies will prepare a detailed, black-and-white proposal document based on the discussed requirements.
- The proposal will outline the final scope, timeline, and pricing.
- Upon receipt and review, the client will provide feedback to proceed with the project.
