# Proposal for Test Client

*Prepared on 23 September 2026*

| | |
|---|---|
| **DOCUMENT** Business Proposal | **CLIENT** Test Client |

## Overview

The client operates an air conditioning service business with a staff of 10 to 12 technicians. Currently, they face significant challenges in manually tracking, assigning, and managing service requests. This proposal outlines a fully automated web application designed to streamline service request handling, intelligent job assignment, and daily technician performance tracking.

## Client Requirements

- Automated assignment of service requests to technicians based on location and current workload.
- Tracking of service request status from assignment to completion, including follow-ups for pending cases.
- Automated daily attendance marking for technicians.
- Intelligent job assignment algorithm that considers the technician's current location, the number of active assignments, and the completion status of existing jobs.
- Exclusion of technicians with negative feedback or bad reviews from receiving new assignments.
- Automated email notifications to the manager for pending cases, specifically cases that remain open for over a year.
- Daily graphical reporting for technicians summarizing daily activities, including service requests attended, requests closed, service charges collected, and new products sold.
- Dedicated staff for service request handling to be repurposed for other tasks once the system is implemented.

## Variations in Schema

- No schema variations identified from the customer requirements discussed in this meeting.

## Proposed Solution

We propose developing a customized web application to address the client's operational challenges. The system will feature distinct interfaces for administrators, managers, and technicians. Key functionalities include a centralized service request dashboard, an automated assignment engine based on location and workload, real-time status tracking, and a dedicated reporting module for daily technician performance metrics.

## Scope of Work

- Development of a web-based service request and job management system.
- Implementation of an automated assignment module utilizing technician location, active job counts, and job status.
- Configuration of automated email alerts for pending and aged service requests.
- Development of a graphical daily performance report for technicians.
- Integration of daily attendance tracking for the technician workforce.
- Hosting and server setup (to be discussed based on client infrastructure).

## Timeline

Not discussed in this meeting — to be confirmed with the client.

## Pricing

- Development and customization of the service request automation system: approximately within one lakh.
- Server hosting and setup: an additional amount, to be confirmed based on client infrastructure requirements.

## Next Steps

- The client will review the detailed proposal and return with feedback.
- A follow-up discussion will be scheduled to finalize the server hosting arrangements and review the remaining automation requirements.
