Proposal for Test Client

Prepared on 23 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

The client operates an air conditioning service business with a team of 10 to 12 staff members. They currently face significant operational challenges in managing service requests, technician assignments, and daily tracking, which consumes a lot of time and manual effort. The purpose of this proposal is to provide a fully automated web application to streamline service request handling, optimize technician dispatch, and generate daily performance reports, thereby freeing up administrative staff for other tasks.

Client Requirements

- **Service Management:** A system to handle incoming customer complaints and service requests.
- **Automated Assignment:** Automatic assignment of service requests to technicians based on specific rules.
- **Location-Based Mapping:** Map the customer's location and assign the request to the nearest available technician in that specific area.
- **Workload Balancing:** Distribute requests based on the current number of open requests, completion status, and time periods to ensure efficient execution.
- **Feedback Exclusion:** Technicians who have received negative feedback or bad reviews should not be assigned new requests.
- **Status Tracking:** Real-time tracking of service requests from assignment to completion (e.g., "Where did it reach?", "Is it done?").
- **Pending Case Follow-up:** Automated identification of pending service requests within a year and escalation.
- **Manager Notifications:** The manager must receive automated email alerts for pending or unresolved cases.
- **Daily Activity Reporting:** A graphical daily report for each technician detailing the number of service requests attended, requests closed, service charges collected, and new products sold.
- **Attendance Management:** Technicians must mark their attendance in the morning after receiving their daily assignments.
- **WhatsApp Chatbot:** Implementation of a WhatsApp chatbot for service request intake.

Variations in Schema

- **Advanced Automated Assignment Logic:** The client requires an intelligent, algorithmic assignment engine that dynamically balances workloads based on location proximity, current open tickets, completion rates, and time windows, rather than a standard manual or basic auto-assign feature.
- **Technician Performance Analytics:** The requirement for a graphical daily activity report containing specific metrics (requests attended, closed, charges collected, products sold) represents a custom reporting variation.
- **WhatsApp Chatbot Integration:** The implementation of a WhatsApp chatbot for intake is a variation not represented in the standard schema.

Proposed Solution

We will develop a customized web application designed to address the client's specific operational workflow. The system will feature distinct interfaces for staff, admins, and technicians.

Key functionalities will include:

- A service management module to log and track customer complaints and requests.
- An automated assignment engine that maps customer locations to technician locations, checks current workloads, and excludes technicians with negative feedback.
- Real-time status updates and tracking capabilities, including automated pending-case identification and email alerts to the manager.
- A daily performance dashboard generating graphical reports for individual technicians.
- An integrated attendance module for technicians to mark their presence upon starting their shift.
- A WhatsApp chatbot to facilitate seamless customer request intake.

Scope of Work

- Design and development of a customized web application.
- Implementation of the automated assignment algorithm based on location, workload, and feedback rules.
- Integration of a WhatsApp chatbot for service request intake.
- Development of the graphical daily activity reporting module.
- Setup of automated email alerts for pending service requests.
- Deployment of the application (hosting to be confirmed based on client's existing infrastructure).

Timeline

Not discussed in this meeting — to be confirmed with the client.

Pricing

- **Software Development:** Approximately within one lakh (₹1,00,000).
- **Hosting/Server:** If the client does not have an existing server, LiveAs Technologies will provide one. This will be an additional cost.

Next Steps

1. Review and approve this proposal.
2. Confirm whether the client has an existing server or requires one from LiveAs Technologies.
3. Finalize the detailed technical specifications and project timeline.
4. Proceed with the development of the customized web application.
