Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal addresses the requirements of a client operating an Air Conditioned (AC) service business with 10 to 12 technicians. The client's primary operational challenge is the manual handling and tracking of daily service requests and complaints, which consumes significant time and resources. The purpose of this proposal is to implement a fully automated web application to manage service requests from creation to closure, optimize technician assignments, and generate daily performance reports for the technicians.

Client Requirements

- Manage daily service requests and complaints for AC servicing.
- Automatically assign new service requests to available technicians based on customer location and technician location.
- Exclude technicians from assignment if they have received negative feedback or bad reviews on previous jobs.
- Ensure assignments are distributed efficiently over a specific time period based on the technician's current workload and pending/completed requests.
- Allow technicians to mark their attendance in the morning and view their assigned tasks.
- Enable tracking of service request status (e.g., new, ongoing, completed, pending) and send notifications/emails to managers regarding pending or overdue cases.
- Generate a daily graphical report for each technician detailing the number of service requests attended, requests closed, service charges collected, and new products sold.
- Address future maintenance costs, service issues, and associated expenses.
- Implement a WhatsApp chatbot.

Variations in Schema

- Automatic assignment logic based on customer location, technician location, current workload, pending/completed requests, and time period.
- Excluding technicians from assignment due to previous negative customer feedback.
- A daily graphical technician activity report containing requests attended, requests closed, service charges collected, and products sold.
- WhatsApp chatbot implementation.

Proposed Solution

We will develop a web-based platform with separate login portals for Admin and Technicians. The system will digitize the entire service request lifecycle. New requests can be raised via a mobile interface or by admin. The platform will feature an intelligent assignment engine to automatically route jobs to the most suitable technician based on geographic proximity, current active jobs, and historical performance feedback. The system will maintain real-time status tracking, send automated notifications to management regarding pending or delayed requests, and generate a daily graphical performance report for each technician detailing their daily activities, collections, and sales.

Scope of Work

- Development of a web application with Admin and Staff/Technician login roles.
- Implementation of an automated service request assignment algorithm.
- Integration of technician location tracking and customer location mapping.
- Configuration of a feedback and negative review tracking system to restrict technician assignments.
- Development of a daily graphical performance dashboard for technicians.
- Implementation of a WhatsApp chatbot.
- Hosting the application on a client-provided server or a LiveAs Technologies server (subject to additional cost).
- Provision of a maintenance and support plan for future service issues.

Timeline

The timeline for project delivery and future automation discussions will be detailed in the formal written proposal.

Pricing

The proposed project amount was discussed as approximately within one lakh (₹1,00,000).

If LiveAs Technologies provides the server, the server will be an additional cost, as discussed in the meeting.

Next Steps

- The formal written proposal will be prepared and sent to the client for review.
- The client will study the proposal, after which remaining questions regarding automation, maintenance, and future costs will be discussed.
