Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

LiveAs Technologies proposes a fully automated web-based service request management system for an AC service business. The client currently manages 10 to 12 technicians who handle daily service complaints and requests. The current manual process of tracking requests, assigning jobs, and monitoring technician progress is time-consuming and causes operational delays. The purpose of this system is to completely automate the end-to-end service request lifecycle, from initial customer complaints to final job closure, thereby freeing up dedicated administrative staff for other tasks and improving overall efficiency.

Client Requirements

- A web-based application with separate staff and admin login options.
- Automatic assignment of service requests to technicians.
- Assignment logic must map customer location to technician location in the same area.
- Assignment must account for technician workload (e.g., number of pending requests) and current location.
- Technicians with previous negative customer feedback or low ratings must be excluded from receiving assignments.
- Technicians must be able to mark their daily attendance upon login.
- Admin must be able to approve technician attendance.
- Automated tracking of service requests with status updates (e.g., new, ongoing, completed) to monitor progress.
- Automated follow-up and tracking of pending service requests, with email notifications sent to the manager for cases pending beyond a specific timeframe.
- Daily graphical reporting for technicians showing the number of service requests attended, closed, service charges collected, and new products sold.
- A dedicated mail ID for each technician to receive their daily activity reports.
- Integration of a WhatsApp chatbot.
- Hosting options for the web application, with the client's own server if available, or an additional cost if LiveAs Technologies provides the server.

Variations in Schema

- Automatic assignment logic: The exact algorithm must dynamically assign requests based on customer location, technician location, current workload, completed/pending requests, and a specific time period, while excluding technicians with previous negative feedback.
- Daily graphical technician activity report: The specific report must contain a graphical summary of requests attended, requests closed, service charges collected, and products sold for each day.
- WhatsApp chatbot: A specific request for a chatbot implementation via WhatsApp.

Proposed Solution

LiveAs Technologies will develop a customized web application to address the client's service management challenges. The platform will feature dual logins for staff and administration. The core of the system will be an intelligent assignment engine that automatically routes incoming service requests to available technicians based on geographical proximity, current job load, and historical performance feedback.

Administrators will have a centralized dashboard to view, assign, and track the status of all service requests. Technicians will use their mobile devices to mark daily attendance and update their work statuses. The system will automatically generate and dispatch daily graphical activity summaries to the specific mail IDs assigned to each technician. Additionally, the platform will include a WhatsApp chatbot interface to facilitate automated communication and service request initiation.

Scope of Work

- Development of a web application with staff and admin portals.
- Configuration of automatic service request assignment based on location, workload, and performance history.
- Setup of an attendance marking and approval module for staff and administrators.
- Implementation of automated email notifications for pending service requests.
- Development of a daily graphical reporting module for technician activities.
- Integration of a WhatsApp chatbot.
- Provision of hosting services for the web application (additional cost applies if client does not provide their own server).

Timeline

The timeline was not discussed in the meeting.

Pricing

The proposed project amount was discussed as approximately within one lakh (₹1,00,000).

If LiveAs Technologies provides the server, the server will be an additional cost, as discussed in the meeting.

Next Steps

- LiveAs Technologies will draft a written proposal outlining the scope of work, timeline, and detailed pricing.
- The client will review the written proposal.
- The remaining questions regarding future automation, maintenance, and service issue handling will be discussed after the proposal is reviewed.
