Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

LiveAs Technologies proposes a fully automated service request handling system for your AC service business. Currently, your 10 to 12 technicians manage service requests manually, which consumes significant time and creates tracking difficulties. The proposed system will digitize the entire lifecycle of service requests, from customer complaints to completion, allowing your dedicated staff to focus on higher-value tasks.

Client Requirements

- A web-based software application with distinct Admin and staff login options.
- An automated service request system where customers can raise requests via mobile phone.
- Automatic assignment of service requests to technicians based on specific conditions.
- The assignment logic must consider customer location, technician location, current workload, and the time period of pending requests.
- Technicians with negative customer feedback or bad reviews must be excluded from automatic assignment.
- Morning attendance marking for technicians.
- Daily graphical activity reports for technicians showing requests attended, requests closed, service charges collected, and new products sold.
- Email reports sent to a designated office mail ID for each technician summarizing their daily activities.
- Tracking of service request status (e.g., new, ongoing, completed) and tracking of pending cases.
- Manager-level email notifications for cases that remain pending or open beyond one year.
- A dedicated system to handle maintenance and future service issues.
- WhatsApp chatbot implementation.

Variations in Schema

- Automatic assignment logic that maps customer location to technician location while factoring in current workload, pending requests, and time periods.
- Excluding technicians from automatic assignment based on previous negative customer feedback.
- A daily graphical technician activity report containing requests attended, requests closed, service charges collected, and products sold.

Proposed Solution

LiveAs Technologies will develop a customized web application tailored to your AC service operations. The platform will feature automated service request intake, intelligent job assignment, and comprehensive tracking. The daily graphical activity reports and manager-level notifications will be integrated directly into the staff dashboard to ensure seamless daily operations.

Scope of Work

- Development of a web application with Admin and staff access.
- Implementation of an automated service request intake and tracking module.

- Configuration of the automatic assignment algorithm based on location, workload, and feedback history.
- Development of daily graphical activity reports for technicians.
- Setup of automated email notifications for pending cases and daily reports.
- Implementation of a WhatsApp chatbot for customer interactions.
- Setup and hosting of the application on a dedicated server (if required).

Timeline

The project will be completed and delivered within approximately one month from the date of signed agreement.

Pricing

The proposed project amount was discussed as approximately within one lakh (₹1,00,000).

If LiveAs Technologies provides the server, the server will be an additional cost, as discussed in the meeting.

Next Steps

- A detailed written proposal will be prepared and sent to you for review.
- Upon your approval, a formal agreement will be signed.
- Any remaining questions regarding maintenance, future automation, and service issues will be discussed and finalized during the implementation phase.
