|---|---|
| **DOCUMENT** Business Proposal | **CLIENT** Test Client |

## Overview

LiveAs Technologies is proposing a fully automated service request handling system for an AC service business. The client currently employs 10 to 12 technicians and relies on manual, behind-the-scenes processes to manage daily service complaints, which consumes significant administrative time and resources. The purpose of this automation is to streamline service request intake, intelligent technician assignment, daily tracking, and reporting to free up staff for other operational tasks and improve overall efficiency.

## Client Requirements

- Automated service request intake and tracking, including status updates (e.g., reached, completed, finished).
- Morning attendance marking for technicians.
- Automatic assignment of service requests to technicians.
- Email notifications to the office mail ID and technicians regarding daily work activities and status updates.
- Follow-up tracking for pending cases, including identifying cases pending for over a year.
- Automatic escalation or notification to the manager for cases pending over a year.

## Variations in Schema

- Automatic assignment using customer location + technician location + current workload + completed/pending requests + time period.
- Excluding a technician from assignment because of previous negative customer feedback.
- A daily graphical technician activity report containing requests attended, requests closed, service charges collected and products sold.
- A WhatsApp chatbot implementation.

## Proposed Solution

LiveAs Technologies will develop a customized web application to replace the client's manual service request handling process. The application will feature distinct login portals for Admin and Staff. The solution will include modules for customer and technician data management, automated service request creation, and a rule-based assignment engine that evaluates location proximity and technician workload. The system will generate daily graphical activity summaries and send automated email updates. The client's dedicated administrative staff can then be reassigned to higher-value operational roles.

## Scope of Work

- Development of a web application with Admin and Staff login capabilities.
- Configuration of customer and technician data entry.
- Implementation of the automatic service request assignment algorithm.
- Development of a daily graphical activity reporting dashboard for technicians.
- Setup of automated email notifications for daily work activities and status updates.
- Setup of automatic manager notifications for service requests pending over a year.

- Hosting the application on a server (to be determined by the client or provided by LiveAs Technologies at an additional cost).
- Provisioning of a WhatsApp chatbot (as a variation to be discussed separately).

## Timeline

The timeline for the project has not yet been finalized and will be included in the detailed proposal document.

## Pricing

The proposed project amount was discussed as approximately within one lakh (₹1,00,000).

If LiveAs Technologies provides the server, the server will be an additional cost, as discussed in the meeting.

## Next Steps

- LiveAs Technologies will draft a detailed written proposal based on the discussed requirements.
- The client will review the proposal.
- The remaining questions regarding maintenance, future costs, and service issue handling will be discussed.
- The implementation of the WhatsApp chatbot will be discussed separately.
