Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines the development of a web application designed to automate and optimize the handling of air-conditioned service requests for a company with 10 to 12 field technicians. The solution will provide dedicated staff and admin interfaces to manage, assign, and track service requests from initiation to completion.

Client Requirements

- Develop a web application for handling AC service requests, including staff and admin roles.
- View service requests and assign them to staff
- The system must allow tracking of service request status from start to finish, including location and completion status.

Variations in Schema

- Automatically assign service requests to technicians based on their location and existing workload.
- The system must not assign service requests to technicians who have received negative feedback or bad reviews.
- The system must send daily email reports to a specific office mail ID summarizing each technician's daily work, including number of service requests attended, closed, charges collected, and new products sold.
- The system must send automatic emails to the manager regarding pending cases that have been open for a year or more.
- Implement a WhatsApp chatbot.

Proposed Solution

The proposed solution is a custom web application that centralizes all service request management. The platform will feature distinct role-based access for staff and administrators to ensure efficient workflow and oversight. The system will dynamically assign incoming service requests to available technicians based on their geographic proximity and current workload capacity. Additionally, the application will incorporate a feedback mechanism to prevent technicians with negative reviews from receiving new assignments. The platform will also include automated email reporting functionalities to keep management and field staff informed of daily activities and long-term pending cases.

Scope of Work

- The scope of work includes the end-to-end development of the web application, encompassing the front-end user interface, back-end logic for request assignment, and database schema design. It covers the implementation of the admin and staff role-based access controls, the development of the automated assignment algorithm, and the setup of the email reporting module. Furthermore, the scope includes the integration of a WhatsApp chatbot for customer interaction and request intake.

Timeline

No timeline information was supplied.

Pricing

The project cost should be within one lakh (100,000).

If the client does not have their own server, the development company will provide a server for an additional cost.

Next Steps

- Review and approve the proposal.
- Finalize the specific office email ID for daily technician reports.
- Discuss and finalize server hosting requirements and associated additional costs if applicable.
- Proceed with the development of the web application.
