Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines a software system to handle service requests for AC maintenance, including complaints and service requests. The system is designed to automate the assignment and tracking of service requests for a team of 10 to 12 technicians, reducing manual administrative overhead and improving operational efficiency.

Client Requirements

- Develop a software system to handle service requests for AC maintenance, including complaints and service requests.
- The system must automatically assign service requests to technicians.
- The system must track the status of service requests, showing if they are pending, reached, done, or finished.
- Technicians must be able to mark their attendance in the morning and view their assigned jobs.

Variations in Schema

- The automatic assignment must be based on the technician's current location and area, and must be executed efficiently using an algorithm over a time period.
- Technicians with negative feedback, bad reviews, or who have given a return should not be assigned new service requests.
- The system must send an email to the manager for any service request that remains open for over a year.
- Technicians must be able to view their daily work activities in a graphical format (like MS).
- Technicians must receive a daily email report summarizing their activities, including how many service requests were attended, how many were closed, how much service charge was collected, and how many new products were sold.
- Implement a WhatsApp chatbot.

Proposed Solution

The proposed solution is a web application that provides distinct interfaces for staff and admin users. The system will feature an automated service request assignment module that maps customer locations to the available technicians in that area, ensuring efficient dispatch. A status tracking dashboard will allow users to monitor the progress of service requests through their lifecycle. The technician interface will include a morning attendance marking feature and a dedicated view for their assigned daily jobs.

Scope of Work

- The development of the web application will cover the following areas:
- Building the core service request handling module to manage AC maintenance complaints.
- Developing the automated assignment logic based on technician location and area.
- Creating a status tracking system with stages for pending, reached, done, and finished.
- Implementing a technician portal for attendance marking and job viewing.
- Configuring the automated email alert system for service requests open over a year.

- Designing a graphical daily activity view for technicians.
- Setting up the automated daily email report generation for technicians.
- Developing and integrating the WhatsApp chatbot.

Timeline

No timeline information was supplied.

Pricing

The software development cost should be approximately one lakh.

If the client does not provide a server, the vendor will provide one for an additional amount.

Next Steps

- Please review this proposal. Once approved, we will draft the final detailed requirements document and send it for your review.
