Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

We propose to develop a software system to manage and automate the handling of service requests and complaints for AC servicing. The solution will provide a centralized platform to view, assign, track, and follow up on service requests, along with automated email notifications to managers for unresolved items.

Client Requirements

- A software system to manage and automate the handling of service requests and complaints for AC servicing.
- View service requests and assign to staffs
- Track the status of service requests (e.g., in progress, completed, pending) and provide follow-up tracking.
- Automatically send emails to managers regarding pending or unresolved service requests.

Variations in Schema

- Automatic assignment of service requests to technicians based on their current location and workload.
- The system must not assign a technician to a request if they have received negative feedback or bad reviews.
- regarding pending or unresolved service requests.
- A graphical dashboard to display daily work activities of technicians, including service requests attended, closed, charges collected, and new products sold.
- Implement a WhatsApp chatbot for service requests.

Proposed Solution

The proposed software will be built as a centralized web-based application to handle the complete lifecycle of AC servicing requests. Users will be able to view incoming service requests and assign them to available staff members. The system will feature a dashboard to track the real-time status of each request (in progress, completed, or pending) and will include a follow-up tracking module. Additionally, the system will automatically trigger email notifications to designated managers whenever a service request remains unresolved or pending.

Scope of Work

- Develop a web-based software application for AC servicing request management.
- Implement a user interface to view and assign service requests to staff.
- Develop backend logic to track request statuses and manage follow-up tracking.
- Configure automated email workflows to notify managers of pending or unresolved service requests.
- Provide written documentation of all requirements for client review and approval.

Timeline

The client will receive written documentation of the requirements for review and study prior to the commencement of the development phase.

Pricing

The software should be developed for an approximate cost of within one lakh.

If the client does not have their own server, the vendor will provide one at an additional cost.

Next Steps

- We will provide the detailed written requirements for your review and approval. Once approved, we will proceed with the development and delivery of the system.
