Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

We propose to develop a fully automated web application designed to streamline the end-to-end management of air conditioner service requests for an HVAC maintenance company. The solution will replace manual administrative processes with a centralized digital platform, automating the intake, tracking, assignment, and reporting of service requests across staff and technician roles.

Client Requirements

- The system must be a web application that services air conditioners, with roles for staff and admin.
- The system must handle customer service requests and complaints.
- The system must allow tracking of service requests from start to finish, including status updates (e.g., 'Where did it reach? Is it done? Is it finished?').
- The system must automatically assign service requests to technicians. Service requests must be assigned based on the customer's location being mapped to the technician's location in the same area. Service requests must be assigned using an intelligent algorithm that considers the technician's current workload and location.
- Technicians must be able to mark their attendance and view their assigned jobs in the morning.
- Technicians must receive a daily email report detailing their work activities, including how many service requests were attended, closed, service charges collected, and new products sold.
- The system must be fully automated for handling service requests.
- The system must send email notifications to the manager for pending service cases.

Variations in Schema

- The system must automatically assign service requests to technicians. Service requests must be assigned based on the customer's location being mapped to the technician's location in the same area. Service requests must be assigned using an intelligent algorithm that considers the technician's current workload and location.
- Service requests must be assigned based on the customer's location being mapped to the technician's location in the same area.
- Technicians with negative feedback or bad reviews must not be assigned new service requests.
- Service requests must be assigned using an intelligent algorithm that considers the technician's current workload and location.
- Technicians must receive a daily email report detailing their work activities, including how many service requests were attended, closed, service charges collected, and new products sold.
- A WhatsApp chatbot implementation is required.

Proposed Solution

The proposed solution is a centralized, cloud-hosted web application that automates the entire service request lifecycle. It will feature a dual-role interface for administrative staff and technicians, ensuring clear visibility and accountability. By integrating a smart routing algorithm, the system will dynamically assign incoming service requests to the most appropriate technician based on geographical proximity, current workload, and historical performance. This eliminates manual desk-bound tracking and ensures balanced

distribution of jobs. Additionally, the system will automate daily operational reporting and managerial oversight through scheduled email notifications.

Scope of Work

- Develop and deploy a web application with distinct administrative and technician user roles.
- Implement a service request module that allows staff to log, categorize, and track customer complaints and service requests through various status stages.
- Build an intelligent assignment engine that automatically routes service requests to available technicians based on mapped location data and current workload.
- Develop a technician portal where users can mark their daily attendance and view their assigned job schedules.
- Configure an automated daily email reporting system to dispatch work summaries to technicians.
- Configure an automated email notification system to alert managers regarding pending service cases.
- Provide a server hosting option if the client does not supply their own infrastructure.

Business Cost & Efficiency Impact

An air-conditioning service company with 10 to 12 staff handling service requests and complaints. They seek to automate the end-to-end tracking, assignment, and reporting of service requests to reduce manual administrative time.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Handling	Manual administrative time spent tracking and updating service requests.	Implement a fully automated web application to handle service requests from start to finish, including status tracking and automatic assignment.	Not yet calculable — input data required Measure: hours/month of manual administrative time Cannot calculate without knowing monthly service request volume and the average time staff spend per request update.
Technician Assignment	Inefficient manual assignment of service requests to technicians.	Implement an intelligent algorithm that automatically assigns requests based on technician location, current workload, and negative review status.	Not yet calculable — input data required Measure: percentage of requests optimally assigned Cannot calculate without knowing the total number of requests and how many are currently assigned optimally.
Technician Reporting	Manual compilation of daily work activities for technicians.	Automate daily email reports to technicians detailing service requests attended, closed, service charges collected, and new products sold.	Not yet calculable — input data required Measure: hours/month of manual report compilation Cannot calculate without knowing the number of technicians and the time spent manually compiling their daily reports.

Client data required for further calculations: Monthly volume of service requests; Average time staff spends per manual service request update; Number of technicians; Average time spent manually compiling a daily report per technician; Current manual assignment efficiency rate

Timeline

The client requested a written proposal (black and white) to review before proceeding.

Pricing

The software development cost should be approximately one lakh.

If the client does not provide their own server, the vendor will provide one for an additional cost.

Next Steps

- We will await the client's review of this proposal. Upon approval, we will proceed with the next phases of the engagement.
