Proposal for Test Client

Prepared on 24 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines the development of a software system to automate the management of air conditioner service requests for an HVAC maintenance company. The system will replace manual administrative processes for request intake, technician assignment, status tracking, and reporting, providing a centralized platform to improve operational efficiency.

Client Requirements

- A software system for managing air conditioner service requests.
- The system must automatically assign service requests to technicians based on their location and availability, without manual intervention. The system must view service requests raised and assign to staffs.
- The system must track the status of service requests from assignment through completion (e.g., where did it reach? is it done? is it finished?).
- The system must send emails to managers regarding pending service requests or cases that have been open for a long time. Report generates automatically as per the format needed and send as mail and WhatsApp if integrated.
- The system must generate a daily graphical report of work activities for each technician, including how many service requests were attended, closed, service charges collected, and new products sold. Download sales MIS Excel with filter features comprehensive, View performance graphs of employees and chart downloadable.

Variations in Schema

- The system must automatically assign service requests to technicians based on their location and availability, without manual intervention.
- The system must send emails to managers regarding pending service requests or cases that have been open for a long time.
- The system must exclude technicians from receiving assignments if they have received negative feedback or bad reviews.
- The system must use an efficient algorithm to distribute requests over a time period, balancing workloads among technicians in the same region.
- The system must generate a daily graphical report of work activities for each technician, including how many service requests were attended, closed, service charges collected, and new products sold.
- A WhatsApp chatbot implementation is required.

Proposed Solution

The proposed solution is a centralized web-based software platform designed to digitize and automate the core service request lifecycle. It will feature an automated dispatch engine that assigns jobs to technicians based on their real-time location and availability, eliminating manual intervention. The platform will provide a real-time dashboard to track the status of all service requests from assignment to completion. Additionally, the system will include an automated reporting module that generates daily graphical and tabular reports on technician performance, sales, and service metrics, which can be downloaded and distributed to management via email.

Scope of Work

- The implementation scope covers the following:
- Development of the core service request management portal.
- Implementation of the automated assignment algorithm based on technician location and availability.
- Setup of a real-time status tracking dashboard for service requests.
- Configuration of automated email alerts for managers regarding pending or long-open cases.
- Development of the daily graphical reporting module, including performance graphs and Excel downloads with comprehensive filtering features.

Business Cost & Efficiency Impact

A company with 10 to 12 staff that handles air conditioner service requests. The business currently relies on manual processes for request intake, technician assignment, status tracking, and reporting, which consumes significant time and requires dedicated administrative staff.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Assignment	Manual labor time for dispatchers/managers to assign jobs and track status.	Automated assignment of service requests to technicians based on location, availability, and performance history, with an efficient algorithm to balance workloads over time.	Not yet calculable — input data required Measure: hours of manual dispatch time per month The exact labor savings cannot be calculated without the monthly volume of service requests and the average time currently spent on manual assignment.
Manager Reporting	Manual compilation of daily graphical reports and emails to managers regarding pending requests.	Automated generation and distribution of daily graphical reports to managers via email and WhatsApp, including pending case alerts.	Not yet calculable — input data required Measure: hours of manual reporting time per day The exact time savings cannot be calculated without knowing the current manual time spent on report generation and pending case identification.
Technician Performance Management	Manual exclusion of technicians with negative feedback from assignments, leading to potential capacity loss if not tracked properly.	System automatically excludes technicians with negative feedback from receiving new assignments.	Not yet calculable — input data required Measure: percentage of technician capacity utilized for active assignments The exact capacity recovery cannot be calculated without knowing the number of technicians excluded and the total technician pool.

Client data required for further calculations: Monthly volume of service requests; Average time spent on manual assignment per request; Average time spent on manual report generation per day; Number of technicians with negative feedback

Timeline

The client requires a written proposal/quote to review before proceeding.

Pricing

The project is expected to be priced at approximately one lakh (100,000).

Providing a server will incur an additional cost.

Next Steps

- Upon review and approval of this proposal, the parties will proceed with the next steps to finalize the project scope and commence the implementation.
