Proposal for Test Client

Prepared on 25 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines the development of a web application to automate and manage AC service requests, technician assignments, and performance tracking for an HVAC service company operating with 10 to 12 staff. The solution will replace manual administrative processes with an automated system for capturing mobile requests, assigning tasks based on location and workload, tracking request status, and generating daily graphical performance reports.

Client Requirements

- A web application for managing AC service requests for 10 to 12 staff.
- Customers should be able to submit service requests and complaints via a mobile phone.
- The system must automatically assign service requests to available technicians.
- The system must track the status of service requests (e.g., where it reached, done, finished, pending) and provide follow-up tracking.
- Managers must receive emails regarding pending service cases.
- The system must generate daily graphical reports of technician work activities, including requests attended, closed, service charges collected, and new products sold.
- Technicians must be able to mark attendance and view their assigned requests in the morning.

Variations in Schema

- The system must automatically assign service requests to available technicians (BOS supports manual assignment to staff, not automatic assignment).
- The system must map customer locations to the locations of available technicians in that area for assignment.
- Technicians with negative feedback, low feedback, or recent returns must be excluded from new assignments.
- The system must assign requests using an intelligent algorithm based on time periods and current technician load.
- The system must generate daily graphical reports of technician work activities, including requests attended, closed, service charges collected, and new products sold (BOS supports sales MIS Excel with filter features comprehensive, employee performance graphs and chart downloadable, and service request management MIS with pie chart summary on count of requests, but does not explicitly support daily graphical reports of technician work activities including service charges collected and new products sold).
- A WhatsApp chatbot implementation for HVAC-related service requests.

Proposed Solution

The proposed solution is a web application designed to digitize and automate the entire HVAC service workflow. It will provide a mobile-accessible interface for customers to submit requests and complaints. The system will feature an automated assignment engine that allocates service requests to available technicians based on their current location, workload, and recent service history. A centralized dashboard will enable technicians to mark their attendance and review their daily assignments. Managers will receive automated

email notifications for pending cases, and the platform will generate daily graphical reports detailing technician productivity, service charges collected, and new products sold.

Scope of Work

- The implementation scope covers the development and deployment of the following features:
- Development of a web application backend and frontend.
- Integration of a mobile-accessible customer portal for service request submission.
- Implementation of an automated technician assignment algorithm based on location, load, and performance history.
- Development of a status tracking module for service requests, including states such as reached, done, finished, and pending.
- Configuration of automated email alerts for managers regarding pending service cases.
- Development of a reporting module to generate daily graphical reports on technician work activities, service charges, and product sales.
- Development of a technician attendance and daily assignment viewing interface.
- Deployment and configuration of the application.

Business Cost & Efficiency Impact

An HVAC service company with 10 to 12 staff handling service requests and complaints. They require a web application to automate the intake, assignment, and tracking of service requests, as well as reporting on technician performance and sales.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Handling	Manual administrative time spent by staff to process, assign, and track service requests.	Implement a web application that automatically captures mobile requests, assigns them, and tracks their status (reached, done, finished, pending).	Illustrative scenario N/A Measure: Hours saved per month on administrative processing Assumption: N/A
Technician Assignment	Inefficient manual assignment of technicians based on physical proximity rather than workload or performance.	Implement an intelligent algorithm that automatically assigns requests based on technician location, current load, and performance history (excluding negative feedback or recent returns).	Illustrative scenario N/A Measure: Number of requests incorrectly assigned due to manual process Assumption: N/A
Technician Performance Reporting	Time spent by management to manually compile daily reports on technician work activities, service charges collected, and new products sold.	Implement a system that generates daily graphical reports of technician work activities, including requests attended, closed, service charges collected, and new products sold.	Illustrative scenario N/A Measure: Hours saved per month on manual report generation Assumption: N/A

Client data required to replace illustrative assumptions: Total monthly service request volume; Average time spent per request in manual handling; Average time spent on manual report generation; Hourly rate of dedicated staff; Number of managers generating reports

Timeline

No timeline information has been provided.

Pricing

The development cost should be within 1 lakh.

Server hosting will be an additional cost if the client does not provide their own server.

Next Steps

- We look forward to discussing the project requirements in detail and providing a formal project plan.
