Proposal for Test Client

Prepared on 25 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines a software solution for an HVAC service and maintenance company operating with 10-12 service staff. The system will automate the handling, assignment, tracking, and escalation of customer service requests and complaints. It will also streamline the daily tracking of technician work activities and associated charges, replacing the current manual administrative processes.

Client Requirements

- The system must handle service requests and complaints from customers for air conditioner services.
- Service requests must be automatically assigned to technicians based on their location.
- The system must track the status of service requests and notify the manager via email if a request remains open for a year.
- The system must track daily work activities of technicians, including service requests attended, closed, service charges collected, and new products sold.

Variations in Schema

- automatically assigned to technicians based on their location
- The system must not assign a technician if they have received negative feedback or returns.
- The assignment algorithm must efficiently assign requests based on time periods and the number of active requests a technician has.
- notify the manager via email if a request remains open for a year
- The system must include a graphical report of work activities.
- The system must include a WhatsApp chatbot for handling HVAC service requests.

Proposed Solution

The proposed solution is a centralized web application designed to replace manual administrative workflows with automated processes. It will provide a structured platform for capturing, routing, and monitoring HVAC service operations. The system will feature an intelligent assignment engine that maps incoming service requests to available technicians based on their geographic location. Additionally, it will include a comprehensive dashboard for managers to track daily technician performance metrics and automated escalation protocols to ensure long-standing service requests are flagged to management.

Scope of Work

- Develop a web application to receive and process air conditioner service requests and complaints.
- Implement an automated technician assignment module based on technician location and availability.
- Configure status tracking for all service requests.
- Set up automated email notifications to the manager for any service request remaining open for a period of one year.
- Build a tracking module for daily technician activities, recording service requests attended, closed, service charges collected, and new products sold.

- Provide server hosting if the client does not supply their own infrastructure.

Business Cost & Efficiency Impact

The client operates an HVAC service company with 10-12 service staff handling service requests and complaints from customers. They currently manage these requests manually, which is time-consuming and requires dedicated administrative staff.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Handling	Dedicated administrative staff time spent on manual assignment and status tracking.	Implement an automated web application to receive, assign, and track service requests.	Illustrative scenario If 15 requests/day * 30 days = 450 requests/month, and 0.5 hours/request = 225 hours/month. This is an illustrative scenario only. Measure: Hours per month spent by administrative staff on manual service request handling. Assumption: The meeting does not provide specific numbers for daily/monthly request volume or exact time spent per request, so a calculation cannot be performed.
Technician Assignment	Inefficient manual assignment leading to potential workload imbalance and assignment of technicians with negative feedback.	Implement an intelligent assignment algorithm that maps customer location to technician location and balances active requests over a time period.	Illustrative scenario If a technician works 160 hours/month and spends 20 hours on manual admin, capacity recovery is (160-20)/160 = 87.5%. This is illustrative only. Measure: Percentage of time technicians spend on non-productive administrative tasks versus actual service delivery. Assumption: The meeting does not provide specific hours for administrative tasks or total work hours, so a calculation cannot be performed.
Technician Performance Tracking	Manual data collection and lack of graphical reporting for daily technician activities.	Implement an automated system with graphical reports to track and display daily technician work activities.	Illustrative scenario If 1 report/week * 4 weeks = 4 reports/month, and 2 hours/report = 8 hours/month. This is illustrative only. Measure: Time saved per month by management in compiling and reviewing technician performance reports. Assumption: The meeting does not provide specific time per report or report frequency, so a calculation cannot be performed.
Customer Communication	Unstructured manual handling of customer requests via mobile phones.	Implement a WhatsApp chatbot to handle initial HVAC service requests.	Illustrative scenario If 15 requests/day * 30 days = 450 requests/month. This is illustrative only. Measure: Number of customer requests handled per month through the chatbot. Assumption: The meeting does not provide a clear daily request volume or operating days, so a calculation cannot be performed.
Complaint Escalation	Lack of automated escalation for unresolved service requests.	Implement an automated email notification to the manager if a service request remains open for a year.	Illustrative scenario If 5,400 requests/year (15/day * 360 days) and 1% remain open = 54 requests/year. This is illustrative only. Measure: Number of unresolved service requests per year that would trigger an automated notification. Assumption: The meeting does not provide total annual requests or the percentage that remain open for a year, so a calculation cannot

			be performed.

Client data required to replace illustrative assumptions: Exact daily service request volume; Time spent per request for manual handling; Total working hours per technician; Time spent on manual reporting; Number of operating days per month; Percentage of requests remaining open for a year

Timeline

The client requires the proposal to be documented and delivered for review before any further proceedings.

Pricing

The proposed software solution is expected to be within one lakh (100,000).

Server hosting will be an additional cost if the client does not provide their own server.

Next Steps

- Please review the proposal and share your feedback. We are prepared to proceed with the next stages of the process upon your approval.
