Proposal for Test Client

Prepared on 25 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines the development of a software application for servicing ACs and related equipment. The solution will focus on automating the intake, tracking, and assignment of customer service requests to eliminate manual administrative overhead and improve operational efficiency.

Client Requirements

- The system must be a software application for servicing ACs and related equipment.
- The system must automatically handle service requests and complaints raised by customers.
- The system must map customer locations to the locations of available technicians in the same area for assignment.
- The system must track the status of service requests from start to finish.
- The system must send emails to the manager regarding pending service cases and follow-ups.
- The system must be completely automated to handle service requests.

Variations in Schema

- Service requests must be automatically assigned to available technicians without manual intervention.
- The system must prevent assigning service requests to technicians who have received negative feedback or bad reviews.
- The system must use an intelligent algorithm to assign requests based on the time period and the current workload of technicians.
- The system must provide daily graphical work activities and reports for technicians, including metrics like requests attended, closed, service charges collected, and new products sold.
- A WhatsApp chatbot for HVAC services must be implemented.

Proposed Solution

The proposed solution is a centralized software application that automates the entire lifecycle of service requests. Upon submission, the system will automatically log the customer's request and complaint, mapping the customer's location to the nearest available technicians. The system will then track the status of each request from initiation to completion. Additionally, the application will automatically send email notifications to the manager for pending cases and required follow-ups, ensuring complete automation of the service workflow.

Scope of Work

- Develop a software application for AC and related equipment servicing.
- Implement automated intake and handling of customer service requests and complaints.
- Build a location mapping module to match customer locations with available technician locations for automatic assignment.
- Develop a status tracking module to monitor service requests from start to finish.
- Configure automated email alerts to the manager regarding pending service cases and follow-ups.

- Ensure the system is fully automated for handling service requests.

Business Cost & Efficiency Impact

An AC and related equipment servicing company with 10-12 staff members who manually handle customer service requests, complaints, and technician assignments, leading to time-consuming tracking and administrative overhead.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Intake and Tracking	Manual administrative labor time spent logging, tracking, and following up on service requests.	Implement a software application that automatically handles service requests and complaints, allowing customers to submit them via a mobile application.	Illustrative scenario If the company receives 100 service requests per month and staff spends 0.5 hours per request, the total admin time is 50 hours/month. Automation could reduce this by a percentage, but the exact saving cannot be calculated without knowing the current time spent. Measure: hours of administrative labor per month Assumption: None
Technician Job Assignment	Manual time spent by managers/staff assigning jobs based on location, workload, and feedback history.	Automate the assignment of service requests to technicians based on their location, current workload, and negative feedback status using an intelligent algorithm.	Illustrative scenario If manual assignment takes 5 minutes per request and automation takes 0.5 minutes, the time saved is 4.5 minutes per request. This cannot be calculated without the specific time values. Measure: time to assign a service request Assumption: None
Technician Performance Reporting	Manual administrative time spent by technicians and managers compiling daily performance reports.	Automate the generation of daily graphical work activity reports for technicians, including metrics on requests attended, closed, service charges collected, and new products sold.	Illustrative scenario If there are 10 technicians and each spends 0.5 hours daily on reporting over a 22-day month, the total admin time is 110 hours/month. Measure: hours of administrative labor per month Assumption: None
Customer Communication	Manual labor time spent by staff answering phone calls to receive service requests and complaints.	Implement a WhatsApp chatbot for HVAC services to automatically handle customer requests and complaints.	Illustrative scenario If the company receives 100 service requests per month and staff spends 0.5 hours per call, the total phone call time is 50 hours/month. Measure: hours of administrative labor per month Assumption: None

Client data required to replace illustrative assumptions: Total number of service requests per month; Average time spent by staff per service request; Average time spent by staff per phone call; Number of working days per month; Average time spent by technicians on daily reporting; Average time spent on manual job assignment

Timeline

The client has indicated a focus on solving the main headache of service requests first, with other requirements to be addressed in subsequent phases.

Pricing

The total investment for the software is approximately one lakh.

If the client does not have a server, the vendor will provide one for an additional cost.

Next Steps

- To proceed, we recommend a detailed discovery phase to finalize the technical specifications and implementation plan. We look forward to collaborating with you to bring this solution to life.
