Proposal for Test Client

Prepared on 25 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

We propose the development of a software system to automate the intake, tracking, and management of AC service requests and complaints for an HVAC service company. The solution will provide a centralized platform for handling service requests, tracking their status, and notifying management via email, replacing manual and inefficient processes with a streamlined digital workflow.

Client Requirements

- Create a software system to handle AC service requests and complaints.
- Track the status of service requests, including whether they are done, finished, or pending.
- Send email notifications to the manager regarding service requests.

Variations in Schema

- Automatically assign service requests to technicians based on their location and current workload.
- Exclude technicians with negative feedback or bad reviews from being assigned new requests.
- Generate a daily graphical report for each technician detailing their work activities, including number of service requests attended, closed, service charges collected, and new products sold.
- Implement a WhatsApp chatbot for HVAC service requests.

Proposed Solution

The proposed solution will be a centralized web application designed to digitize and manage the entire AC service request lifecycle. The system will allow staff to log incoming service requests and complaints through a simple interface. Once a request is entered, the system will track its status through defined stages, such as pending, in-progress, done, or finished. The platform will also include an automated email notification module that triggers alerts to the manager whenever a new service request is created or its status changes.

Scope of Work

- The implementation scope covers the development of a web-based software system with the following functional components:
- A service request intake module for logging customer AC service requests and complaints.
- A status tracking module to monitor and update the progress of each service request.
- An automated email notification engine to send updates to the manager.
- A basic administrative interface for staff to manage daily operations.

Business Cost & Efficiency Impact

An AC service company with 10 to 12 staff handling daily service requests and complaints. The client seeks to automate service request intake, assignment, and status tracking, and to generate daily graphical performance reports for technicians.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Intake and	Manual handling of service	Implement a software system with	Illustrative scenario

Assignment	requests by 10-12 staff, consuming significant time and effort.	automated assignment based on technician location, workload, and feedback status (excluding technicians with negative feedback).	If 10 requests are handled daily, and 5 minutes are spent per request on assignment and status updates, total manual admin time is 50 minutes per day. Measure: Total manual admin hours spent on service request handling per day/month Assumption: Benchmark values are illustrative as no specific hourly rates or time measurements were provided.
Technician Performance Reporting	Manual effort to compile and report daily technician activities, including service requests attended, closed, charges collected, and products sold.	Generate daily graphical reports for each technician automatically, detailing work activities and performance metrics.	Illustrative scenario If there are 11 technicians and 15 minutes are spent per report, total manual reporting time is 165 minutes per day. Measure: Total manual admin hours spent on generating daily technician reports Assumption: Benchmark values are illustrative as no specific hourly rates or time measurements were provided.
Customer Communication	Manual handling of customer requests and lack of a dedicated communication channel.	Implement a WhatsApp chatbot for HVAC service requests to automate intake and initial communication.	Illustrative scenario If 10 requests are handled daily and 10 minutes are spent per request, total manual intake time is 100 minutes per day. Measure: Total manual admin hours spent on initial customer request intake and communication Assumption: Benchmark values are illustrative as no specific hourly rates or time measurements were provided.

Client data required to replace illustrative assumptions: Time spent manually assigning one service request; Time spent manually updating status for one service request; Time spent manually generating one technician's daily report; Time spent manually handling one customer request; Hourly rate of staff; Number of technicians; Number of negative feedback technicians to exclude

Timeline

No specific timeline has been provided by the client.

Pricing

The development cost for the system should be approximately within one lakh.

Providing an external server for hosting the application will be an additional cost.

Next Steps

- We propose scheduling a follow-up meeting to discuss the technical specifications, confirm the hosting arrangements, and align on the final project requirements.
