Proposal for Test Client

Prepared on 25 September 2026

DOCUMENT Business Proposal	**CLIENT** Test Client

Overview

This proposal outlines a software system to automate and manage daily AC service operations. The solution is designed to replace manual tracking and assignment processes, enabling the HVAC company to handle service requests, complaints, and follow-ups more efficiently.

Client Requirements

- Create a software system to handle AC service requests, complaints, and follow-ups.
- The system must automatically assign incoming service requests to technicians without manual intervention, and the system must send email alerts to the manager regarding pending service requests.
- The system must allow tracking of service requests from start to finish, including status updates on whether the service is done or pending.
- The system must send email alerts to the manager regarding pending service requests.

Variations in Schema

- The system must automatically assign incoming service requests to technicians without manual intervention.
- Service requests must be assigned to technicians based on their current location, workload, and past negative feedback.
- The system must generate a daily graphical report of technicians' work activities, including service requests attended, closed, charges collected, and new products sold.
- Implement a WhatsApp chatbot for HVAC-related service requests.

Proposed Solution

The proposed system will be a centralized software platform tailored to HVAC service operations. It will digitize the entire lifecycle of a service request. Upon receiving a request, the system will automatically route it to the most appropriate technician based on predefined criteria, eliminating manual desk work. Managers will receive automated email notifications for any requests that remain pending. The platform will provide a real-time dashboard to track the status of every service from initiation to completion.

Scope of Work

- Develop a software system to process and track AC service requests, complaints, and follow-ups.
- Implement an automated assignment module to allocate incoming service requests to technicians without manual intervention.
- Integrate an email notification system to alert the manager of pending service requests.
- Build a tracking module to monitor the status of service requests, indicating whether a service is pending or completed.
- Host the application on a server, with hosting costs billed separately if the client does not provide their own server infrastructure.

Business Cost & Efficiency Impact

An HVAC service company with 10 to 12 staff members handling daily service requests, complaints, and follow-ups manually, leading to significant time consumption and tracking inefficiencies.

Business Area	Current Driver	Automation Opportunity	Impact / Measurement
Service Request Handling	Manual tracking and status updates consume labor time.	Implement a software system to automatically assign incoming service requests to technicians without manual intervention, with status updates and email alerts to the manager for pending requests.	Illustrative scenario If daily_requests = 10, time_per_request_manual = 30 minutes, and time_per_request_automated = 5 minutes, then monthly savings = (10 * 30 - 10 * 5) * 22 working days = 5500 minutes. Measure: hours/month Assumption: Time savings cannot be calculated without knowing the exact time spent per request manually and with automation.
Technician Assignment	Manual assignment based on location and workload is inefficient and may lead to poor customer satisfaction due to negative feedback not being considered.	Automatically assign requests based on technician location, current workload, and past negative feedback, using an algorithm.	**Example calculation (illustrative)** If daily_requests = 10, then monthly assignments = 10 * 22 = 220. Industry assumption — validate with client data Measure: number of assignments per month Assumption: This is a volume calculation, not a savings calculation, as no cost or time per assignment is provided.
Daily Reporting	Manual compilation of daily graphical reports for technicians' work activities.	Generate a daily graphical report automatically for each technician.	Illustrative scenario If daily_reports = 12 (one per technician), time_per_report_manual = 15 minutes, and time_per_report_automated = 2 minutes, then monthly savings = (12 * 15 - 12 * 2) * 22 = 3744 minutes. Measure: hours/month Assumption: Time savings cannot be calculated without knowing the number of reports and the time spent on them manually and with automation.

Client data required to replace illustrative assumptions: Average daily service requests; Time spent per request manually; Time spent per request with automation; Number of daily reports; Time spent per report manually; Time spent per report with automation

Timeline

The client has requested a written proposal to review before proceeding with the project.

Pricing

The estimated cost for the software development should be within one lakh.

Server hosting is an additional cost if the client does not provide their own server.

Next Steps

- Please review this proposal. Upon your approval, we can proceed with the next steps to initiate the development process.
